# Iran's South Pars phases 11-24 to produce over 350 MMcm/year

Remaining development at Iran's supergiant South Pars field could boost gas output from the area by more than 350 MMcm/year in the coming years, according to Iranian state media.

Development phases 11-24 will eventually produce an additional 19 MMcf/day (196 MMcm/year) of sour gas, 15 MMcf/day (155 MMcm/year) of sweet gas and 710,000 barrels/day of condensate, energy news agency Shana said.
