Nascent Utica shale gas production to “dramatically increase”

A report by the Ohio Department of Natural Resources (ODNR) issued on Monday said that, based on five producing wells drilled in visual_editor011, the Utica/Point Pleasant shale formations showed “significant” gas production potential. Production of dry and wet gas will “dramatically increase” once processing plants start up. The wells included in the study operated for between 53 and visual_editor06 days in visual_editor011, and produced visual_editor.5 Bcf of dry and wet gas.
